(54) Title: MOTILIN HOMOLOGS

(57) Abstract

The present invention is directed to polynucleotides, polypeptides and peptide fragments thereof, and uses thereof for a novel cDNA sequence which has homology to motilin. Tissue distribution of the mRNA for the novel polypeptide is specific to the stomach, small intestine and pancreas. The present invention further includes agonsits, antagonists, antibodies, host cells expressing the cDNA encoding the novel motilin homologs and methods for increasing gastric motility using the novel molecules.

DESCRIPTION MOTILIN HOMOLOGS

BACKGROUND OF THE INVENTION

5

Many of the regulatory peptides that important in maintaining nutritional homeostasis are found in the gastrointestinal environment. These peptides may 10 be synthesized in the digestive system and act locally, but can also be identified in the brain as well. addition, the reverse is also found, i.e., peptides are synthesized in the brain, but found to regulate cells in the gastrointestinal tract. This phenomena has been called the "brain-qut axis" and is important for signaling temperature regulating body and satiety, physiological processes that require feedback between the brain and qut.

20 The peptide hormones include gastrin, gut cholecystokinin (CCK), secretin, gastric inhibitory peptide (GIP), vasoactive intestinal polypeptide (VIP), motilin, somatostatin, pancreatic peptide (PP), substance P and neuropeptide Y (NPY), and use several different For example, gastrin, motilin and mechanisms of action. CCK function as endocrine- and neurocrine-type hormones. Others, such as gastrin and GIP, are thought to act exclusively in an endocrine fashion. Other modes of action include a combination of endocrine, neurocrine and paracrine action (somatostatin); exclusively neurocrine and a combination of neurocrine (NPY); action paracrine actions (VIP and Substance P). Most of the gut hormone actions are mediated by membrane-bound receptors and activate second messenger systems. For a review of gut peptides see, Mulvihill et al., in Basic and Clinical 35 Endocrinology, pp.551-570, 4th edition Greenspan F. S. and

Baxter, J. D. editors., Appleton & Lange: Norwalk, Connecticut, 1994.

Many of these gut peptides are synthesized as inactive precursor molecules that require multiple peptide cleavages to be activated. The family known as the "glucagon-secretin" family which includes VIP, gastrin, secretin, motilin, glucagon and galanin exemplifies peptides regulated by multiple cleavages and post-translational modifications.

Motilin is a 22 amino acid peptide found in gut 10 tissue of mammalian species (Domschke, W., Digestive <u>Diseases</u> 22(5):454-461, 1977). The DNA and amino acid sequences for porcine prepromotilin have been identified (U.S. Patent 5,006,469). Motilin has been identified as a factor capable of increasing gastric motility, affecting 15 the secretory function of the stomach by stimulating pepsin secretion (Brown et al., Canadian J. of Physiol. Pharmacol. 49:399-405, 1971), and recent evidence suggests a role in myoelectric regulation of stomach and small of motilin have Cyclic increases 20 intestine. of the interdigestive III correlated with phase myoelectric complex and the hunger contraction of the duodenum (Chey et al., in <u>Gut Hormones</u>, (eds.) Bloom, S.R., pp. 355-358, Edinburgh, Churchill Livingstone, 1978; Lee et al, Am. J. Digestive Diseases, 23:789-795, 1978; 25 and Itoh et al., Am. J. Digestive Diseases, 23:929-935, Motilin and analogues of motilin have been demonstrated to produce contraction of gastrointestinal smooth muscle, but not other types of smooth muscle cells (Strunz et al., Gastroenterology 68:1485-1491, 1975). 30

The present invention is directed to a novel secreted protein with homology to motilin, found to be transcribed in the gastrointestinal system. The discovery of this novel peptide is important for further elucidation of the how the body maintains its nutritional homeostasis and development of therapeutics to intervene in those

processes, as well as other uses that will be apparent from the teachings therein.

SUMMARY OF THE INVENTION

5

10

Within one aspect, the present invention provides an isolated polynucleotide molecule encoding a polypeptide selected from the group consisting of: (a) polynucleotide molecules comprising a nucleotide sequence as shown in SEQ ID NO: 1 from nucleotide 70 to nucleotide 111; (b) allelic variants of (a); (c) orthologs of (a) and (b); and (d) degenerate nucleotide sequences of (a), (b) or (c).

Within another aspect, the present invention provides an isolated polypeptide selected from the group consisting of: (a) polypeptide molecules comprising an amino acid sequence as shown in SEQ ID NO: 2 from residue 24 to residue 37; (b) allelic variants of (a); and (c) orthologs of (a) or (b).

aspect, the present invention In another 20 provides an expression vector comprising the following operably linked elements: a transcription promoter; a DNA the group consisting of: segment selected from polynucleotide molecules comprising a nucleotide sequence as shown in SEQ ID NO: 1 from nucleotide 70 to nucleotide 25 111; (b) allelic variants of (a); (c) orthologs of (a) or (b); and (d) degenerate nucleotide sequences of (a), (b) or (c); a transcription terminator.

In another aspect, the present invention provides a cultured cell into which has been introduced an expression vector comprising the following operably linked elements: a transcription promoter; a DNA segment selected from the group consisting of: (a) polynucleotide molecules comprising a nucleotide sequence as shown in SEQ ID NO: 1 from nucleotide 70 to nucleotide 111; (b) allelic variants of (a); (c) orthologs of (a) or (b); and (d) degenerate

15

25

nucleotide sequences of (a), (b) or (c); a transcription terminator, wherein said cell expresses the polypeptide encoded by the DNA segment.

aspect, the present invention another In 5 provides a pharmaceutical composition comprising purified polypeptide selected from the group consisting of: polypeptide molecules comprising an amino acid sequence as shown in SEQ ID NO: 2 from residue 24 to residue 37; (b) allelic variants of (a); and (c) orthologs of (a) or (b), in combination with a pharmaceutically acceptable vehicle.

present invention aspect, the another In provides an antibody that binds to an epitope of a polypeptide selected from the group consisting of: (a) polypeptide molecules comprising an amino acid sequence as shown in SEQ ID NO: 2 from residue 24 to residue 117; (b) allelic variants of (a); and (c) orthologs of (a) or (b).

aspect, present invention another the In a method of producing a zsiq33 polypeptide provides into which has cell comprising: culturing a 20 introduced an expression vector comprising the following operably linked elements: a transcription promoter; a DNA from the group consisting of: selected polynucleotide molecules comprising a nucleotide sequence as shown in SEQ ID NO: 1 from nucleotide 70 to nucleotide 111; (b) allelic variants of (a); (c) orthologs of (a) or (b); and (d) degenerate nucleotide sequences of (a), (b) or (c); a transcription terminator, whereby said cell expresses a polypeptide encoded by the DNA segment; and recovering the polypeptide.

invention the present 30 another aspect, method of stimulating gastric motility provides a comprising administering to a mammal in need thereof, an amount of a composition comprising an isolated polypeptide selected from the group consisting of: (a) polypeptide molecules comprising an amino acid sequence as shown in 35 SEQ ID NO: 2 from residue 24 to residue 37; (b)

variants of (a); and (c) orthologs of (a) or (b); in a pharmaceutically acceptable vehicle, sufficient to increase transit time or gastric emptying of an ingested substance.

5

DETAILED DESCRIPTION OF THE INVENTION

Prior to describing the present invention in detail, it may be helpful to define certain terms used herein:

The term "ortholog" denotes a polypeptide or protein obtained from one species that is the functional counterpart of a polypeptide or protein from a different species. Sequence differences among orthologs are the result of speciation.

"Paralogs" are distinct but structurally related proteins made by an organism. Paralogs are believed to arise through gene duplication. For example, α -globin, β -globin, and myoglobin are paralogs of each other.

The term "allelic variant" denotes any of two or 20 more alternative forms of a gene occupying the same chromosomal locus. Allelic variation arises naturally mutation, and may result through in phenotypic polymorphism within populations. Gene mutations can be (no change in the encoded polypeptide) or may silent 25 encode polypeptides having altered amino acid sequence. The term allelic variant is also used herein to denote a protein encoded by an allelic variant of a gene.

The term "expression vector" denotes a DNA molecule, linear or circular, that comprises a segment 30 encoding a polypeptide of interest operably linked to additional segments that provide for its transcription. Such additional segments may include promoter and terminator sequences, and may optionally include one or more origins of replication, one or more selectable 35 markers, an enhancer, a polyadenylation signal, and the

35

like. Expression vectors are generally derived from plasmid or viral DNA, or may contain elements of both.

when term "isolated", applied a polynucleotide molecule, denotes that the polynucleotide has been removed from its natural genetic milieu and is extraneous or unwanted thus of other free sequences, and is in a form suitable for use within genetically engineered protein production systems. isolated molecules are those that are separated from their natural environment and include cDNA and genomic clones. 10 Isolated DNA molecules of the present invention are free of other genes with which they are ordinarily associated, but may include naturally occurring 5' and 3' untranslated and terminators. promoters such as regions identification of associated regions will be evident to 15 one of ordinary skill in the art (see for example, Dynan and Tijan, Nature 316:774-78, 1985). When applied to a protein, the term "isolated" indicates that the protein is found in a condition other than its native environment, such as apart from blood and animal tissue. 20 preferred form, the isolated protein is substantially free of other proteins, particularly other proteins of animal It is preferred to provide the protein in a origin. highly purified form, i.e., greater than 95% pure, more preferably greater than 99% pure. 25

The term "operably linked", when referring to DNA segments, denotes that the segments are arranged so that they function in concert for their intended purposes, e.g. transcription initiates in the promoter and proceeds through the coding segment to the terminator

The term "polynucleotide" denotes a single- or double-stranded polymer of deoxyribonucleotide or ribonucleotide bases read from the 5' to the 3' end. Polynucleotides include RNA and DNA, and may be isolated from natural sources, synthesized in vitro, or prepared from a combination of natural and synthetic molecules.

The term "complements of polynucleotide molecules" denotes polynucleotide molecules having a complementary base sequence and reverse orientation as compared to a reference sequence. For example, the sequence 5' ATGCACGGG 3' is complementary to 5' CCCGTGCAT 3'.

"degenerate nucleotide The term sequence" denotes a sequence of nucleotides that includes one or compared more degenerate codons (as to a reference that polynucleotide molecule encodes а polypeptide). codons contain different triplets Degenerate nucleotides, but encode the same amino acid residue (i.e., GAU and GAC triplets each encode Asp).

The term "promoter" denotes a portion of a gene containing DNA sequences that provide for the binding of RNA polymerase and initiation of transcription. Promoter sequences are commonly, but not always, found in the 5' non-coding regions of genes.

The term "secretory signal sequence" denotes a 20 DNA sequence that encodes a polypeptide (a "secretory peptide") that, as a component of a larger polypeptide, directs the larger polypeptide through a secretory pathway of a cell in which it is synthesized. The larger peptide is commonly cleaved to remove the secretory peptide during 25 transit through the secretory pathway.

The term "receptor" denotes a cell-associated protein that binds to a bioactive molecule (i.e., a ligand) and mediates the effect of the ligand on the cell. Membrane-bound receptors are characterized by a multi-30 domain structure comprising an extracellular binding domain and an intracellular effector domain that is typically involved in signal transduction. Binding of ligand to receptor results in a conformational change in the receptor that causes an interaction between the effector domain and other molecule(s) in the cell. interaction in turn leads to an alteration in

15

20

Metabolic events that are linked metabolism of the cell. interactions include gene receptor-ligand dephosphorylation, phosphorylation, transcription, mobilization in cyclic AMP production, increases cellular calcium, mobilization of membrane lipids, cell adhesion, hydrolysis of inositol lipids and hydrolysis of Most nuclear receptors also exhibit a phospholipids. amino-terminal, including an structure, multi-domain transactivating domain, a DNA binding domain and a ligand In general, receptors can be membrane binding domain. bound, cytosolic or nuclear; monomeric (e.g., thyroid stimulating hormone receptor, beta-adrenergic receptor) or multimeric (e.g., PDGF receptor, growth hormone receptor, G-CSF receptor, receptor, GM-CSF receptor, erythropoietin receptor and IL-6 receptor).

"complement/anti-complement The term denotes non-identical moieties that form a non-covalently associated, stable pair under appropriate conditions. avidin (or streptavidin) instance, biotin and prototypical members of a complement/anti-complement pair. Other exemplary complement/anti-complement pairs include receptor/ligand pairs, antibody/antigen (or hapten epitope) pairs, sense/antisense polynucleotide pairs, dissociation the Where subsequent like. the desirable, the 25 complement/anti-complement pair is complement/anti-complement pair preferably has a binding affinity of $<10^9 \,\mathrm{M}^{-1}$.

All references cited herein are incorporated by reference in their entirety.

The present invention is based in part upon the 30 discovery of a novel human DNA sequence that encodes a novel secreted polypeptide having homology to motilin, of which the closest homolog is porcine motilin (shown in SEQ ID NOs: 3 and 4). Motilin is member of a family of gastrointestinal that requlate the polypeptides 35 The family of polypeptides important in physiology.

25

gastrointestinal regulation to which motilin belongs glucagon, gastrin, galanin, and vasoactive includes intestinal peptide (VIP). These polypeptides synthesized in a precursor form that requires multiple 5 steps of processing to the active form. relevant to the polypeptide of the present invention are motilin, VIP and galanin, where processing involves removal of signal sequence, followed by cleavage of one or more accessory peptides to release the active peptide. The resulting active peptide is generally small (10-30 10 amino acids) and may require further post-translational modifications, such as amidation, sulfation or pyrrolidan carbonylic acid modification of glutamic residues.

Analysis of the tissue distribution of the mRNA corresponding to this novel DNA showed that expression was highest in stomach, followed by apparent but decreased expression levels in small intestine and pancreas. The EST is also present in lung cDNA libraries. The polypeptide has been designated zsig33.

The novel zsig33 polynucleotides and polypeptides of the present invention were initially identified by querying an EST database for sequences possessing a putative secretion signal. An EST sequence was discovered and predicted to be related to the motilin family. The EST sequence was derived from a fetal pancreatic library.

The novel polypeptide encoded by the full length cDNA is 117 amino acids. The predicted signal sequence is 23 amino acid residues (amino acid residues 1 to 23 of SEO The active peptide was predicted to be 16 30 ID NO: 2). amino acid residues (amino acid residues 24 to 41 of SEQ ID NO: 2), with a C-terminal cleavage after amino acid residue 41 of SEQ ID NO: 2 (Ser). However, many of the gut-brain peptides require multiple cleavages. For 35 example, progastrin peptide is 101 amino acids, and is cleaved at the N-terminus resulting in sequentially

15

20

25

35

smaller peptides (G34, G17 and G14) (Sugano et al., J. Biol. Chem. 260:11724-11729, 1985). Other peptides that require multiple processing steps include glucagon, for which C-terminal cleavages result in glucagon-like peptide and glucagon-like peptide 2 and galanin, processing involves cleavage of a C-terminal peptide known Therefore, an additional peptide based on cleavage after amino acid 37 of SEQ ID NO: 2 (Gln) was synthesized and resulted in a 14 amino acid peptide with biological activity (from amino acid residue 24 (Gly) to amino acid residue 37 (Gln) of SEQ ID NO: 2).

The C-terminal peptide (amino acid 42 to 117 of SEQ ID NO: 2) may have some specialized activity as well. Processing of the active peptide for motilin (shown in SEQ ID NO: 4) results in a release of a C-terminal peptide of 70 amino acids, amino acid residue 50 (Ser) to amino acid residue 119 (Lys), known as motilin-associated peptide Adelman et al., (U.S. Patent 5,006,469) have (MAP). postulated that MAP plays a role in regulation digestion, appetite and nutrient absorption.

highly conserved amino acids in the polypeptide zsig33 can be used as a tool to identify new For instance, reverse transcriptionfamily members. polymerase chain reaction (RT-PCR) can be used to amplify sequences encoding the conserved motif from RNA obtained from a variety of tissue sources. Two such conserved domains have been identified using sequences from the The first domain is found at amino present invention. acid residues 31 to 36 of SEQ ID NO: 2, wherein the motif 30 identified is Glu X Gln Arg X Gln, wherein X is any amino acid residue (shown in SEQ ID NO: 5), and the second domain is found at amino acid residues 78 to 84 of SEQ ID NO: 2, wherein the motif identified is Ala Pro X Asp X Gly Ile, wherein X is any amino acid residue (shown in SEQ ID In particular, highly degenerate primers designed NO: 6). from these sequences are useful for this purpose.

Those skilled in the art will readily recognize that, in view of the degeneracy of the genetic code, considerable sequence variation is possible among these polynucleotide molecules encoding SEQ ID NO:2, including 5 all RNA sequences by substituting U for T. Thus, zsig33 polypeptide-encoding polynucleotides and their equivalents are contemplated by the present invention. Table 1 sets forth the one-letter codes used to denote degenerate nucleotide positions. "Resolutions" are the 10 nucleotides denoted by a code letter. "Complement" indicates the code for the complementary nucleotide(s). For example, the code Y denotes either C or T, and its complement R denotes A or G, A being complementary to T, and G being complementary to C.

15

20

25

30

35

One of ordinary skill in the art will appreciate ambiguity is introduced in determining a some degenerate codon, representative of all possible codons For example, the degenerate encoding each amino acid. codon for serine (WSN) can, in some circumstances, encode arginine (AGR), and the degenerate codon for arginine (MGN) can, in some circumstances, encode serine (AGY). between codons relationship exists phenylalanine and leucine. Thus, some polynucleotides encompassed by the degenerate sequence may encode variant amino acid sequences, but one of ordinary skill in the art can easily identify such variant sequences by reference to the amino acid sequence of SEQ ID NO:2. Variant sequences can be readily tested for functionality as herein.

Within preferred embodiments of the invention the isolated polynucleotides will hybridize to similar sized regions of SEQ ID NO: 1, or a sequence complementary thereto, under stringent conditions. In general, stringent conditions are selected to be about 5°C lower than the thermal melting point (T_m) for the specific sequence at a defined ionic strength and pH. The T_m is the temperature (under defined ionic strength and pH) at which 50% of the target sequence hybridizes to a perfectly matched probe. Typical stringent conditions are those in which the salt concentration is at least about 0.02 M at pH 7 and the temperature is at least about 60°C.

As previously noted, the isolated polynucleotides of the present invention include DNA and RNA. Methods for isolating DNA and RNA are well known in the art. It is generally preferred to isolate RNA from stomach, although DNA can also be prepared using RNA from other tissues or isolated as genomic DNA. Total RNA can be prepared using guanidine HCl extraction followed by isolation by centrifugation in a CsCl gradient (Chirgwin et al., Biochemistry 18:52-94, 1979). Poly (A)+ RNA is

10

prepared from total RNA using the method of Aviv and Leder (Proc. Natl. Acad. Sci. USA <u>69</u>:1408-1412, 1972). Complementary DNA (cDNA) is prepared from poly(A) + RNA using known methods. Polynucleotides encoding zsig33 polypeptides are then identified and isolated by, example, hybridization or PCR.

invention further The provides present counterpart polypeptides and polynucleotides from other species (orthologs). Of particular interest are zsiq33 from other mammalian species, polypeptides murine, rat, porcine, ovine, bovine, canine, feline. equine and other primate proteins. Orthologs of the human proteins can be cloned using information and compositions provided by the present invention in combination with 15 conventional cloning techniques. For example, a cDNA can be cloned using mRNA obtained from a tissue or cell type that expresses the protein. Suitable sources of mRNA can identified by probing Northern blots with probes designed from the sequences disclosed herein. is then prepared from mRNA of a positive tissue of cell 20 zsig33 ortholog-encoding cDNA can then isolated by a variety of methods, such as by probing with a complete or partial human cDNA or with one or more sets of degenerate probes based on the disclosed sequences. can also be cloned using the polymerase 25 reaction, or PCR (Mullis, U.S. Patent 4,683,202), using primers designed from the sequences disclosed herein. Within an additional method, the cDNA library can be used to transform or transfect host cells, and expression of the cDNA of interest can be detected with an antibody to -. 30 Similar techniques can also be applied to the isolation of genomic clones.

Those skilled in the art will recognize that the sequences disclosed in SEQ ID NO: 1, and polypeptide 35 encoded thereby, represent a single allele of the human zsiq33 gene and polypeptide, and that allelic variation

and alternative splicing are expected to occur. Allelic variants can be cloned by probing cDNA or genomic libraries from different individuals according to standard procedures. Allelic variants of the DNA sequence shown in SEQ ID NO: 1, including those containing silent mutations and those in which mutations result in amino acid sequence changes, are within the scope of the present invention, as are proteins which are the product of allelic variation of SEQ ID NO: 2.

The present invention also provides 10 zsig33 polypeptides that are substantially homologous to the polypeptides of SEQ ID NO: 2 and their orthologs. term "substantially homologous" is used herein to denote polypeptides having 50%, preferably 60%, more preferably at least 80%, sequence identity to the sequences shown in 15 SEQ ID NO: 2 or their orthologs. Such polypeptides will more preferably be at least 90% identical, and most preferably 95% or more identical to SEQ ID NO: 2 or its Percent sequence identity is determined by See, for example, Altschul et al., conventional methods. 20 Bull. Math. Bio. 48: 603-616, 1986 and Henikoff and Henikoff, Proc. Natl. Acad. Sci. USA 89:10915-10919, 1992. Briefly, two amino acid sequences are aligned to optimize the alignment scores using a gap opening penalty of 10, a gap extension penalty of 1, and the "blosum 62" scoring 25 matrix of Henikoff and Henikoff (ibid.) as shown in Table 3 (amino acids are indicated by the standard one-letter codes).

The percent identity is then calculated as: Total number of identical matches

x 100

[length of the longer sequence plus the number of gaps introduced into the longer sequence in order to align the two sequences]

Sequence identity of polynucleotide molecules is determined by similar methods using a ratio as disclosed above.

homologous proteins Substantially 10 polypeptides are characterized as having one or more amino acid substitutions, deletions or additions. These changes are preferably of a minor nature, that is conservative (see Table 4) and other amino acid substitutions substitutions that do not significantly affect the folding 15 the protein or polypeptide; activity of deletions, typically of one to about 30 amino acids; and small amino- or carboxyl-terminal extensions, such as an amino-terminal methionine residue, a small linker peptide of up to about 20-25 residues, or a small extension that 20 facilitates purification (an affinity tag), such as a polyhistidine tract, protein A (Nilsson et al., EMBO J. 4:1075, 1985; Nilsson et al., Methods Enzymol. 198:3, 1991), glutathione S transferase (Smith and Johnson, Gene maltose binding protein (Kellerman and 67:31, 1988), 25 Ferenci, Methods Enzymol. 90:459-463, 1982; Guan et al., Gene 67:21-30, 1987), thioredoxin, ubiquitin, cellulose binding protein, T7 polymerase, or other antigenic epitope or binding domain. See, in general Ford et al., Protein Expression and Purification 2: 95-107, 1991, which is 30 incorporated herein by reference. DNAs encoding affinity tags are available from commercial suppliers (e.g., Pharmacia Biotech, Piscataway, NJ; New England Biolabs, Beverly, MA).

In addition to the 20 standard amino acids, nonstandard amino acids (such as 4-hydroxyproline, 6-N-methyl lysine, 2-aminoisobutyric acid, isovaline and α -methyl serine) may be substituted for amino acid residues of 25 A limited number of non-conservative amino acids, amino acids that are not encoded by the genetic code, and unnatural amino acids may be substituted for zsig33 amino acid residues. "Unnatural amino acids" have been modified after protein synthesis, and/or have a chemical structure in their side chain(s) different from that of the standard amino acids. Unnatural amino acids can be chemically synthesized, or preferably, are commercially available, and include pipecolic acid, thiazolidine carboxylic acid, 35 dehydroproline, 3 and 4-methylproline, and 3,3dimethylproline.

Essential amino acids in the zsig33 polypeptides of the present invention can be identified according to in the art, such as site-directed procedures known mutagenesis or alanine-scanning mutagenesis (Cunningham 5 and Wells, <u>Science</u> <u>244</u>: 1081-1085, 1989). In the latter technique, single alanine mutations are introduced at every residue in the molecule, and the resultant mutant molecules are tested for biological activity gastrointestinal cell contractility, stimulation of uptake and/or secretion of of nutrient 10 modulation digestive enzymes) to identify amino acid residues that are critical to the activity of the molecule. See also, Hilton et al., <u>J. Biol. Chem.</u> <u>271</u>:4699-4708, 1996. of ligand-receptor interaction can also be determined by physical analysis of structure, as determined by such 15 techniques as nuclear magnetic resonance, crystallography, diffraction or photoaffinity labeling, electron conjunction with mutation of putative contact site amino acids. See, for example, de Vos et al., Science 255:306-312, 1992; Smith et al., <u>J. Mol. Biol.</u> 224:899-904, 1992; 20 al., <u>FEBS Lett.</u> 309:59-64, Wlodaver et identities of essential amino acids can also be inferred from analysis of homologies with related members of the glucagon-secretin family of gut-brain peptide hormones.

Multiple amino acid substitutions can be made tested using known methods of mutagenesis and screening, such as those disclosed by Reidhaar-Olson and Sauer (Science 241:53-57, 1988) or Bowie and Sauer (Proc. Natl. Acad. Sci. USA 86:2152-2156, 1989). Briefly, these authors disclose methods for simultaneously randomizing 30 two or more positions in a polypeptide, selecting for polypeptide, and then sequencing functional mutagenized polypeptides to determine the spectrum of allowable substitutions at each position. Other methods that can be used include phage display (e.g., Lowman et al., <u>Biochem.</u> 30:10832-10837, 1991; Ladner et al., U.S.

15

20

Patent No. 5,223,409; Huse, WIPO Publication WO 92/06204) and region-directed mutagenesis (Derbyshire et al., <u>Gene 46</u>:145, 1986; Ner et al., <u>DNA 7</u>:127, 1988).

Mutagenesis methods as disclosed above can be combined with high-throughput, automated screening methods to detect activity of cloned, mutagenized polypeptides in Mutagenized DNA molecules that encode active host cells. polypeptides (e.g., stimulation of gastrointestinal cell modulation of nutrient uptake contractility, secretion of digestive enzymes) can be recovered from the host cells and rapidly sequenced using modern equipment. These methods allow the rapid determination of importance of individual amino acid residues a be polypeptide of interest, and can applied to polypeptides of unknown structure.

Using the methods discussed above, one of ordinary skill in the art can identify and/or prepare a variety of polypeptides that are substantially homologous to residues 24 to 37 of SEQ ID NO: 2 or allelic variants thereof and retain properties of the wild-type protein. Such polypeptides may also include additional polypeptide segments as generally disclosed above.

polypeptides of the present invention, The including full-length proteins and fragments thereof, can be produced in genetically engineered host cells according to conventional techniques. Suitable host cells are those cell types that can be transformed or transfected with exogenous DNA and grown in culture, and include bacteria, fungal cells, and cultured higher eukaryotic cells. particularly cultured 30 Eukaryotic cells, cells multicellular organisms, are preferred. Techniques for manipulating cloned DNA molecules and introducing exogenous DNA into a variety of host cells are disclosed by Sambrook et al., Molecular Cloning: A Laboratory Manual, 2nd ed., Cold Spring Harbor Laboratory Press, Cold 35 Spring Harbor, NY, 1989, and Ausubel et al. (eds.),

Current Protocols in Molecular Biology, John Wiley and Sons, Inc., NY, 1987, which are incorporated herein by reference.

In general, a DNA sequence encoding a zsig33 5 polypeptide of the present invention is operably linked to other genetic elements required for its expression, transcription promoter including a generally terminator within an expression vector. The vector will also commonly contain one or more selectable markers and one or more origins of replication, although those skilled in the art will recognize that within certain systems selectable markers may be provided on separate vectors, and replication of the exogenous DNA may be provided by integration into the host cell genome. Selection of 15 promoters, terminators, selectable markers, vectors and other elements is a matter of routine design within the level of ordinary skill in the art. Many such elements are described in the literature and are available through commercial suppliers.

zsig33 polypeptide into To direct a secretory pathway of a host cell, a secretory signal sequence (also known as a leader sequence, prepro sequence or pre sequence) is provided in the expression vector. The secretory signal sequence may be that of the zsig33 polypeptide, or may be derived from another secreted 25 protein (e.g., t-PA) or synthesized de novo. secretory signal sequence is joined to the zsig33 DNA sequence in the correct reading frame. Secretory signal sequences are commonly positioned 5' to the DNA sequence encoding the propeptide of interest, although certain 30 signal sequences may be positioned elsewhere in the DNA sequence of interest (see, e.g., Welch et al., U.S. Patent No. 5,037,743; Holland et al., U.S. Patent No. 5,143,830).

Cultured mammalian cells are also preferred Methods for invention. 35 hosts within the present DNA into mammalian host cells introducing exogenous

include calcium phosphate-mediated transfection (Wigler et al., Cell 14:725, 1978; Corsaro and Pearson, Somatic Cell Genetics 7:603, 1981: Graham and Van der Eb, Virology 52:456, 1973), electroporation (Neumann et al., EMBO J. DEAE-dextran mediated transfection 1982), 5 1:841-845. (Ausubel et al., eds., Current Protocols in Molecular Biology, John Wiley and Sons, Inc., NY, 1987), liposomemediated transfection (Hawley-Nelson et al., Focus 15:73, 1993: Ciccarone et al., Focus 15:80, 1993), and viral 10 vectors (A. Miller and G. Rosman, BioTechniques 7:980-90, 1989; Q. Wang and M. Finer, Nature Med. 2:714-16, 1996), incorporated herein by reference. are of recombinant polypeptides in production mammalian cells is disclosed, for example, by Levinson et 15 al., U.S. Patent No. 4,713,339; Hagen et al., U.S. Patent No. 4,784,950; Palmiter et al., U.S. Patent No. 4,579,821; U.S. Patent No. 4,656,134, which and Ringold, incorporated herein by reference. Preferred cultured mammalian cells include the COS-1 (ATCC No. CRL 1650), 20 COS-7 (ATCC No. CRL 1651), BHK 570 (ATCC No. CRL 10314), 293 (ATCC No. CRL 1573; Graham et al., <u>J. Gen. Virol.</u> 36:59-72, 1977) and Chinese hamster ovary (e.g. CHO-K1; ATCC No. CCL 61) cell lines. Additional suitable cell lines are known in the art and available from public 25 depositories such as the American Type Culture Collection, Rockville, Maryland. In general, strong transcription promoters are preferred, such as promoters from SV-40 or cytomegalovirus. See, e.g., U.S. Patent No. 4,956,288. from those promoters include Other suitable metallothionein genes (U.S. Patent Nos. 4,579,821 4,601,978, which are incorporated herein by reference) and the adenovirus major late promoter.

Drug selection is generally used to select for cultured mammalian cells into which foreign DNA has been inserted. Such cells are commonly referred to as "transfectants". Cells that have been cultured in the

presence of the selective agent and are able to pass the gene of interest to their progeny are referred to as "stable transfectants." A preferred selectable marker is a gene encoding resistance to the antibiotic neomycin. Selection is carried out in the presence of a neomycintype drug, such as G-418 or the like. Selection systems may also be used to increase the expression level of the interest, a process referred to of as "amplification." Amplification is carried out by culturing transfectants in the presence of a low level of the selective agent and then increasing the amount of selective agent to select for cells that produce high levels of the products of the introduced genes. preferred amplifiable selectable marker is dihydrofolate 15 reductase, which confers resistance to methotrexate. Other drug resistance genes (e.g., hygromycin resistance, multi-drug resistance, puromycin acetyltransferase) can also be used. Alternative markers that introduce an altered phenotype, such as green fluorescent protein, or cell surface proteins such as CD4, CD8, Class I MHC, alkaline phosphatase may be used to placental transfected cells from untransfected cells by such means as FACS sorting or magnetic bead separation technology.

Other higher eukaryotic cells can also be used as hosts, including plant cells, insect cells and avian The use of Agrobacterium rhizogenes as a vector for expressing genes in plant cells has been reviewed by Sinkar et al., <u>J. Biosci</u>. (<u>Bangalore</u>) <u>11</u>:47-58, 1987. Transformation of insect cells and production of foreign polypeptides therein is disclosed by Guarino et al., U.S. Patent No. 5,162,222 and WIPO publication WO 94/06463. Insect cells can be infected with recombinant baculovirus, commonly derived from Autographa californica nuclear DNA encoding the polyhedrosis virus (AcNPV). polypeptide is inserted into the baculoviral genome in 35 place of the AcNPV polyhedrin gene coding sequence by one

of two methods. The first is the traditional method of homologous DNA recombination between wild-type AcNPV and a transfer vector containing the zsig33 flanked by AcNPV sequences. Suitable insect cells, e.g. SF9 cells, are infected with wild-type AcNPV and transfected with a comprising a zsig33 transfer vector polynucleotide operably linked to an AcNPV polyhedrin gene promoter, terminator, and flanking sequences. See, King, L.A. and Possee, R.D., The Baculovirus Expression System: A Laboratory Guide, London, Chapman & Hall; O'Reilly, D.R. 10 et al., Baculovirus Expression Vectors: A Laboratory Manual, New York, Oxford University Press., 1994; and, Richardson, C. D., Ed., Baculovirus Expression Protocols. Methods in Molecular Biology, Totowa, NJ, Humana Press, Natural recombination within an insect cell will 15 1995. result in a recombinant baculovirus which contains zsiq33 driven by the polyhedrin promoter. Recombinant viral stocks are made by methods commonly used in the art.

The second method of making baculovirus utilizes a transposon-based system described 20 by Luckow (Luckow, V.A, et al., <u>J Virol</u> 67:4566-79, 1993). sold in the Bac-to-Bac kit This system is Technologies, Rockville, MD). This system utilizes a transfer vector, $pFastBacl^{TM}$ (Life Technologies) containing 25 a Tn7 transposon to move the DNA encoding the zsiq33 polypeptide into a baculovirus genome maintained in E. coli as a large plasmid called a "bacmid." The pFastBac1™ transfer vector utilizes the AcNPV polyhedrin promoter to drive the expression of the gene of interest, in this case 30 zsig33. However, pFastBac1™ can be modified considerable degree. The polyhedrin promoter can be removed and substituted with the baculovirus basic protein promoter (also known as Pcor, p6.9 or MP promoter) which is expressed earlier in the baculovirus infection, and has 35 been shown to be advantageous for expressing secreted proteins. See, Hill-Perkins, M.S. and Possee, R.D., J Gen

Virol 71:971-6, 1990; Bonning, B.C. et al., <u>J Gen Virol</u> 75:1551-6, 1994; and, Chazenbalk, G.D., and Rapoport, B., J Biol Chem 270:1543-9, 1995. In such transfer vector constructs, a short or long version of the basic protein Moreover, transfer vectors can be 5 promoter can be used. constructed which replace the native zsig33 secretory signal sequences with secretory signal sequences derived from insect proteins. For example, a secretory signal sequence from Ecdysteroid Glucosyltransferase (EGT), honey bee Melittin (Invitrogen, Carlsbad, CA), or baculovirus 10 gp67 (PharMingen, San Diego, CA) can be used in constructs to replace the native zsig33 secretory signal sequence. In addition, transfer vectors can include an in-frame fusion with DNA encoding an epitope tag at the C- or Nterminus of the expressed zsig33 polypeptide, for example, 15 a Glu-Glu epitope tag (Grussenmeyer, T. et al., Proc Natl <u>Acad Sci.</u> <u>82</u>:7952-4, 1985). Using a technique known in transfer vector containing zsiq33 is the transformed into E. Coli, and screened for bacmids which contain an interrupted lacZ gene indicative of recombinant 20 The bacmid DNA containing the recombinant baculovirus. baculovirus genome is isolated, using common techniques, and used to transfect Spodoptera frugiperda cells, e.g. Recombinant virus that expresses zsig33 is Sf9 cells. subsequently produced. Recombinant viral stocks are made 25 by methods commonly used the art.

The recombinant virus is used to infect host typically a cell line derived from cells, the fall armyworm, Spodoptera frugiperda. See, in general, Glick 30 and Pasternak, Molecular Biotechnology: Principles and Applications of Recombinant DNA, ASM Press, Washington, D.C., 1994. Another suitable cell line is the High FiveO™ cell line (Invitrogen) derived from Trichoplusia ni (U.S. Commercially available serum-free Patent #5,300,435). media are used to grow and maintain the cells. 35 Suitable media are Sf900 II™ (Life Technologies) or ESF 921TM

(Expression Systems) for the Sf9 cells; and Ex-cellO405™ (JRH Biosciences, Lenexa, KS) or Express FiveO[™] (Life Technologies) for the T. ni cells. The cells are grown up from an inoculation density of approximately $2-5 \times 10^5$ cells to a density of $1-2 \times 10^6$ cells at which time a recombinant viral stock is added at a multiplicity of infection (MOI) of 0.1 to 10, more typically near 3. recombinant virus-infected cells typically produce the zsig33 polypeptide at 12-72 hours postrecombinant infection and secrete it with varying efficiency into the The culture is usually harvested 48 hours postmedium. Centrifugation is used to separate the cells infection. from the medium (supernatant). The supernatant containing zsig33 polypeptide is filtered through micropore filters, usually 0.45 μm pore size. Procedures used are 15 generally described in available laboratory manuals (King, L. A. and Possee, R.D., ibid.; O'Reilly, D.R. et al., ibid.; Richardson, C. D., ibid.). Subsequent purification of the zsig33 polypeptide from the supernatant can be achieved using methods described herein. 20

yeast cells. including Fungal cells, particularly cells of the genera Saccharomyces and Pichia, can also be used within the present invention, such as for polypeptide producing zsig33 fragments or Methods for transforming yeast cells with exogenous DNA 25 producing recombinant polypeptides therefrom disclosed by, for example, Kawasaki, U.S. Patent 4,599,311; Kawasaki et al., U.S. Patent No. 4,931,373; Brake, U.S. Patent No. 4,870,008; Welch et al., U.S. Patent No. 5,037,743; and Murray et al., U.S. Patent No. 4,845,075, which are incorporated herein by reference. Transformed cells are selected by phenotype determined by the selectable marker, commonly drug resistance or the ability to grow in the absence of a particular nutrient (e.g., leucine). A preferred vector system for use in 35 yeast is the POT1 vector system disclosed by Kawasaki et

al. (U.S. Patent No. 4,931,373), which allows transformed cells to be selected by growth in glucose-containing Suitable promoters and terminators for use in yeast include those from glycolytic enzyme genes (see, e.g., Kawasaki, U.S. Patent No. 4,599,311; Kingsman et al., U.S. Patent No. 4,615,974; and Bitter, U.S. Patent No. 4,977,092, which are incorporated herein by reference) and alcohol dehydrogenase genes. See also U.S. Patents Nos. 4,990,446; 5,063,154; 5,139,936 and 4,661,454, which are incorporated herein by reference. Transformation 10 systems for other yeasts, including Hansenula polymorpha, Kluyveromyces Schizosaccharomyces pombe, Kluyveromyces fragilis, Ustilago maydis, Pichia pastoris, guillermondiï, Pichia methanolica and Candida 15 maltosa are known in the art. See, for example, Gleeson et al., <u>J. Gen. Microbiol.</u> <u>132</u>:3459-3465, 1986 and Cregg, Aspergillus cells may be U.S. Patent No. 4,882,279. utilized according to the methods of McKnight et al., U.S. Patent No. 4,935,349, which is incorporated herein by transforming Acremonium Methods for 20 reference. chrysogenum are disclosed by Sumino et al., U.S. Patent No. 5,162,228, which is incorporated herein by reference. Methods for transforming Neurospora are disclosed by No. 4,486,533, U.S. Patent Lambowitz, incorporated herein by reference. 25

Transformed or transfected host cells are cultured according to conventional procedures in a culture medium containing nutrients and other components required for the growth of the chosen host cells. A variety of suitable media, including defined media and complex media, are known in the art and generally include a carbon source, a nitrogen source, essential amino acids, vitamins and minerals. Media may also contain such components as growth factors or serum, as required. The growth medium will generally select for cells containing the exogenously

added DNA by, for example, drug selection or deficiency in an essential nutrient which is complemented by the selectable marker carried on the expression vector or cotransfected into the host cell. P. methanolica cells are cultured in a medium comprising adequate sources of carbon, nitrogen and trace nutrients at a temperature of about 25°C to 35°C. Liquid cultures are provided with sufficient aeration by conventional means, such as shaking of small flasks or sparging of fermentors. A preferred culture medium for P. methanolica is YEPD (2% D-glucose, 2% BactoTM Peptone (Difco Laboratories, Detroit, MI), 1% BactoTM yeast extract (Difco Laboratories), 0.004% adenine and 0.006% L-leucine).

Expressed recombinant zsig33 polypeptides can be fractionation and/or conventional using 15 purified methods and media. Ammonium sulfate purification precipitation and acid or chaotrope extraction may be used for fractionation of samples. Exemplary purification steps may include hydroxyapatite, size exclusion, FPLC and reverse-phase high performance liquid chromatography. 20 include derivatized exchange media Suitable anion dextrans, agarose, cellulose, polyacrylamide, specialty silicas, and the like. PEI, DEAE, QAE and Q derivatives are preferred, with DEAE Fast-Flow Sepharose (Pharmacia, Piscataway, NJ) being particularly preferred. Exemplary 25 chromatographic media include those media derivatized with phenyl, butyl, or octyl groups, such as Phenyl-Sepharose butyl 650 (Toso (Pharmacia), Toyopearl Montgomeryville, PA), Octyl-Sepharose (Pharmacia) and the like; or polyacrylic resins, such as Amberchrom CG 71 30 (Toso Haas) and the like. Suitable solid supports include beads, silica-based resins, cellulosic agarose beads, cross-linked agarose beads, polystyrene beads, cross-linked polyacrylamide resins and the like that are insoluble under the conditions in which they are 35 to be used. These supports may be modified with reactive

groups that allow attachment of proteins by amino groups, carboxyl groups, sulfhydryl groups, hydroxyl groups and/or carbohydrate moieties. Examples of coupling chemistries include cyanogen bromide activation, N-hydroxysuccinimide epoxide activation, sulfhydryl 5 activation, hydrazide activation, and carboxyl and amino derivatives for carbodiimide coupling chemistries. These and other solid media are well known and widely used in the art, and Methods for are available from commercial suppliers. 10 binding receptor polypeptides to support media are well known in the art. Selection of a particular method is a matter of routine design and is determined in part by the properties of the chosen support. See, for example, Affinity Chromatography: Principles & Methods, Pharmacia 15 LKB Biotechnology, Uppsala, Sweden, 1988.

The polypeptides of the present invention can be isolated by exploitation of small size and low pI. example, polypeptides of the present invention can be bound to anionic exchanges at low pH values. include purification purification of 20 methods glycosylated proteins by lectin affinity chromatography and ion exchange chromatography (Methods in Enzymol., Vol. 182, "Guide to Protein Purification", M. Deutscher, (ed.), Acad. Press, San Diego, 1990, pp.529-39). Alternatively, a fusion of the polypeptide of interest and an affinity (e.g., polyhistidine, maltose-binding protein, immunoglobulin domain) may be constructed to facilitate purification.

Protein refolding (and optionally reoxidation) 30 procedures may be advantageously used. It is preferred to purify the protein to >80% purity, more preferably to >90% purity, even more preferably >95%, and particularly preferred is a pharmaceutically pure state, that greater than 99.9% pure with respect to contaminating macromolecules, particularly other proteins and nucleic 35 acids, and free of infectious and pyrogenic

Preferably, a purified protein is substantially free of other proteins, particularly other proteins of animal origin.

zsig33 polypeptides or fragments thereof may also be prepared through chemical synthesis. polypeptides may be monomers or multimers; glycosylated or non-glycosylated; pegylated or non-pegylated; amidated or non-amidated; sulfated or non-sulfated; and may or may not include an initial methionine amino acid residue. example, zsig33 polypeptides can also be synthesized by 10 exclusive solid phase synthesis, partial solid phase methods, fragment condensation or classical The polypeptides are preferably prepared by synthesis. solid phase peptide synthesis, for example as described by Merrifield, <u>J. Am. Chem. Soc</u>. <u>85</u>:2149, 15 1963. The synthesis is carried out with amino acids that are protected at the alpha-amino terminus. Trifunctional . amino acids with labile side-chains are also protected groups to prevent undesired chemical suitable reactions from occurring during the assembly of the 20 alpha-amino protecting group polypeptides. The selectively removed to allow subsequent reaction to take place at the amino-terminus. The conditions for the removal of the alpha-amino protecting group do not remove the side-chain protecting groups.

The alpha-amino protecting groups are those known to be useful in the art of stepwise polypeptide synthesis. Included are acyl type protecting groups formyl, trifluoroacetyl, acetyl), (e.g., aryl 30 protecting groups (e.g., biotinyl), aromatic urethane type benzyloxycarbonyl groups [e.g., protecting substituted benzyloxycarbonyl and 9-fluorenylmethyloxycarbonyl (Fmoc)], aliphatic urethane protecting groups [e.g., t-butyloxycarbonyl (tBoc), isopropyloxycarbonyl, cyclohexloxycarbonyl] and alkyl type protecting groups

35

(e.g., benzyl, triphenylmethyl). The preferred protecting groups are tBoc and Fmoc.

The side-chain protecting groups selected must remain intact during coupling and not be removed during 5 the deprotection of the amino-terminus protecting group or The side-chain protecting during coupling conditions. groups must also be removable upon the completion of synthesis using reaction conditions that will not alter the finished polypeptide. In tBoc chemistry, the sidechain protecting groups for trifunctional amino acids are 10 mostly benzyl based. In Fmoc chemistry, they are mostly tert-butyl or trityl based.

In tBoc chemistry, the preferred side-chain protecting groups are tosyl for arginine, cyclohexyl for aspartic acid, 4-methylbenzyl (and acetamidomethyl) for cysteine, benzyl for glutamic acid, serine and threonine, benzyloxymethyl (and dinitrophenyl) for histidine, 2-Clbenzyloxycarbonyl for lysine, formyl for tryptophan and 2-Fmoc chemistry, In tyrosine. for bromobenzyl 20 preferred side-chain protecting groups are 2,2,5,7,8pentamethylchroman-6-sulfonyl 2,2,4,6,7-(Pmc) orfor pentamethyldihydrobenzofuran-5-sulfonyl (Pbf) arginine, trityl for asparagine, cysteine, glutamine and histidine, tert-butyl for aspartic acid, glutamic acid, serine, threonine and tyrosine, tBoc for lysine tryptophan.

For the synthesis of phosphopeptides, direct or post-assembly incorporation of the phosphate group is used. In the direct incorporation strategy, the phosphate group on serine, threonine or tyrosine may be 30 tert-butyl in Fmoc protected by methyl, benzyl, or phenyl methyl, benzyl in tBoc oror by chemistry chemistry. Direct incorporation of phosphotyrosine without phosphate protection can also be used in Fmoc chemistry. incorporation strategy, post-assembly the unprotected hydroxyl groups of serine, threonine or tyrosine are derivatized on solid phase with di-tert-butyl-, dibenzyl- or dimethyl-N,N'-diisopropylphosphoramidite and then oxidized by tert-butylhydroperoxide.

Solid phase synthesis is usually carried out 5 from the carboxyl-terminus by coupling the alpha-amino protected (side-chain protected) amino acid to a suitable An ester linkage is formed when the solid support. attachment is made to a chloromethyl, chlortrityl or hydroxymethyl resin, and the resulting polypeptide will 10 group at the C-terminus. free carboxyl Alternatively, when an amide resin such as benzhydrylamine or p-methylbenzhydrylamine resin (for tBoc chemistry) and Rink amide or PAL resin (for Fmoc chemistry) are used, an 15 amide bond is formed and the resulting polypeptide will have a carboxamide group at the C-terminus. These resins, polystyreneor polyamide-based whether polyethyleneglycol-grafted, with or without a handle or linker, with or without the first amino acid attached, are 20 commercially available, and their preparations have been al., "Solid Phase described by Stewart et Synthesis" (2nd Edition), (Pierce Chemical Co., Rockford, IL, 1984) and Bayer & Rapp Chem. Pept. Prot. 3:3 (1986); and Atherton et al., Solid Phase Peptide Synthesis: A Practical Approach, IRL Press, Oxford, 1989. 25

The C-terminal amino acid, protected at the side chain if necessary, and at the alpha-amino group, attached to a hydroxylmethyl resin using agents including dicyclohexylcarbodiimide activating N, N'-diisopropylcarbodiimide (DIPCDI) and 30 (DCC), be attached to (CDI). Ιt can carbonyldiimidazole chloromethyl or chlorotrityl resin directly in its cesium tetramethylammonium salt form or in the presence of triethylamine (TEA) or diisopropylethylamine (DIEA). First 35 amino acid attachment to an amide resin is the same as amide bond formation during coupling reactions.

Following the attachment to the resin support, the alpha-amino protecting group is removed using various reagents depending on the protecting chemistry (e.g., tBoc, Fmoc). The extent of Fmoc removal can be monitored at 300-320 nm or by a conductivity cell. After removal of the alpha-amino protecting group, the remaining protected amino acids are coupled stepwise in the required order to obtain the desired sequence.

Various activating agents can be used for the 10 coupling reactions including DCC, DIPCDI, 2-chloro-1,3dimethylimidium hexafluorophosphate (CIP), benzotriazol-1yl-oxy-tris-(dimethylamino)-phosphonium hexafluorophosphate (BOP) and its pyrrolidine analog (PyBOP), bromotris-pyrrolidino-phosphonium hexafluorophosphate (PyBroP), O-(benzotriazol-1-yl)-1,1,3,3-tetramethyl-uronium 15 tetrafluoroborate hexafluorophosphate (HBTU) and its analog (TBTU) or its pyrrolidine analog (HBPyU), O-(7azabenzotriazol-1-yl)-1,1,3,3-tetramethyl-uronium tetrafluoroborate hexafluorophosphate (HATU) and its analog (TATU) or its pyrrolidine analog (HAPyU). The most 20 common catalytic additives used in coupling reactions include 4-dimethylaminopyridine (DMAP), 3-hydroxy-3,4-(HODhbt), dihydro-4-oxo-1,2,3-benzotriazine 1-hydroxy-7hydroxybenzotriazole (HOBt) and Each protected amino acid is azabenzotriazole (HOAt). 25 used in excess (>2.0 equivalents), and the couplings are usually carried out in N-methylpyrrolidone (NMP) or in DMF, CH2Cl2 or mixtures thereof. The extent of completion of the coupling reaction can be monitored at each stage, e.g., by the ninhydrin reaction as described by Kaiser et 30 al., Anal. Biochem. 34:595, 1970.

After the entire assembly of the desired peptide, the peptide-resin is cleaved with a reagent with proper scavengers. The Fmoc peptides are usually cleaved and deprotected by TFA with scavengers (e.g., H2O, ethanedithiol, phenol and thioanisole). The tBoc peptides

25

are usually cleaved and deprotected with liquid HF for 1-2 hours at -5 to 0° C, which cleaves the polypeptide from the resin and removes most of the side-chain protecting groups. Scavengers such as anisole, dimethylsulfide and p-5 thiocresol are usually used with the liquid HF to prevent cations formed during the cleavage from alkylating and amino acid residues acylating the present in The formyl group of tryptophan polypeptide. and the dinitrophenyl group of histidine need to be removed, 10 respectively by piperidine and thiophenyl in DMF prior to The acetamidomethyl group of cysteine the HF cleavage. can be removed by mercury(II) acetate and alternatively by iodine, thallium(III) trifluoroacetate or tetrafluoroborate which simultaneously oxidize cysteine to 15 cystine. Other strong acids used for tBoc peptide cleavage deprotection include trifluoromethanesulfonic (TFMSA) and trimethylsilyltrifluoroacetate (TMSOTf).

The activity of molecules of the present invention can be measured using a variety of assays that stimulation of gastrointestinal measure modulation of nutrient and/or contractility, uptake secretion of digestive enzymes. Of particular interest are changes in contractility of smooth muscle cells. example, the contractile response of segments of mammalian duodenum or other gastrointestinal smooth muscles tissue (Depoortere et al., J. Gastrointestinal Motility 1:150-1989, incorporated herein by reference). An exemplary in vivo assay uses an ultrasonic micrometer to dimensional changes radially between measure the 30 commissures and longiturdinally to the plane of the valve base (Hansen et al., Society of Thoracic Surgeons 60:S384-390, 1995).

Gastric motility is generally measured in the clinical setting as the time required for gastric emptying 35 and subsequent transit time through the gastrointestinal tract. Gastric emptying scans are well known to those

skilled in the art, and briefly, comprise use of an oral contrast agent, such as barium, or a radiolabeled meal. Solids and liquids can be measured independently. A test food or liquid is radiolabeled with an isotope (e.g. 5 ** "Tc), and after ingestion or administration, transit time through the gastrointestinal tract and gastric emptying are measured by visualization using gamma cameras (Meyer et al., Am. J. Dig. Dis. 21:296, 1976; Collins et al., Gut 24:1117, 1983; Maughan et al., Diabet. Med. 13 9 Supp. 10 5:S6-10, 1996 and Horowitz et al., Arch. Intern. Med. 145:1467-1472, 1985). These studies may be performed before and after the administration of a promotility agent to quantify the efficacy of the drug.

Assays measuring zsig33 polypeptides ability to affect cell proliferation or differentiation are well 15 For example, assays known in the art. measuring proliferation include such assays as chemosensitivity to neutral red dye (Cavanaugh et al., Investigational New Drugs 8:347-354, 1990, incorporated herein by reference), 20 incorporation of radiolabelled nucleotides (Cook et al., Analytical Biochem. 179:1-7, 1989, incorporated herein by incorporation of 5-bromo-2'-deoxyuridine reference), (BrdU) in the DNA of proliferating cells (Porstmann et al., J. Immunol. Methods 82:169-179, 1985, incorporated herein by reference), and use of tetrazolium (Mosmann, J. Immunol. Methods 65:55-63, 1983; Alley et al., Cancer Res. 48:589-601, 1988; Marshall et al., Growth Req. 5:69-84, 1995; and Scudiero et al., <u>Cancer Res.</u> 48:4827-4833, 1988; all incorporated herein by reference). 30 Assays measuring differentiation include, for example, measuring cell-surface markers associated with stagespecific expression of a tissue, enzymatic activity, functional activity or morphological changes (Watt, FASEB, 5:281-284, 1991; Francis, <u>Differentiation</u> 57:63-75, 1994; Raes, Adv. Anim. Cell Biol. Technol. Bioprocesses, 161-35 171, 1989; all incorporated herein by reference).

Assays can be used to measure other cellular responses, that include, chemotaxis, adhesion, changes in ion channel influx, regulation of second messenger levels and neurotransmitter release. Such assays are well known in the art. See, for example, in "Basic & Clinical Endocrinology Ser., Vol. Vol. 3," Cytochemical Bioassays: Techniques & Applications, Chayen; Chayen, Bitensky, eds., Dekker, New York, 1983.

In view of the tissue distribution observed for zsiq33, agonists (including the natural ligand/ substrate/ 10 cofactor/ etc.) and antagonists have enormous potential in in vitro and in vivo applications. identified as zsig33 agonists are useful for promoting gastrointestinal cell stimulation of contractility, 15 modulation of nutrient uptake and/or secretion digestive enzymes in vivo and in vitro. For example, agonist compounds are useful as components of defined cell culture media and regulate the uptake of nutrients, and are useful in specifically promoting the growth and/or development of gastrointestinal cells such as G 20 cells, enterochromaffin cells and the epithelial mucosa of duodenum, proximal jejunum, the stomach, antrum fundus.

family of gut-brain peptides has The been 25 associated with neurological and CNS functions. For example, NPY, a peptide with receptors in both the brain and the gut has been shown to stimulate appetite when administered to the central nervous system (Gehlert, Life <u>Sciences</u> <u>55(6)</u>:551-562, 1994). Motilin immunoreactivity has been identified in different regions of the brain, 30 particularly the cerebellum, and in the pituitary (Gasparini et al., <u>Hum. Genetics</u> 94(6):671-674, Motilin has been found to coexist with neurotransmitter γaminobutyric acid in cerebellum (Chan-Patay, Proc. Sym. 35 50th Anniv. Meet. Br. Pharmalog. Soc.:1-24, 1982). Physiological studies have provided some evidence that

motilin has an affect on feeding behavior (Rosenfield et al., Phys. Behav. 39(6):735-736, 1987), bladder control, pituitary growth hormone release. Other gut-brain peptides, such as CCK, enkephalin, VIP and secretin have been shown to be involved in control of blood pressure, heart rate, behavior, and pain modulation, in addition to be active in the digestive system. Therefore, zsig33, or some portion thereof, could be expected to have some neurological association.

10 Using site-specific changes in the amino acid and DNA sequences of the present invention analogs can be made that are either antagonists, agonists or partial agonists (Macielay et al., Peptides: Chem. Struct. Biol. pp.659, 1996). Antagonists are useful for clinical conditions associated with gastrointestinal hypermotility such as diarrhea and Crohn's disease. Antagonists are also useful as research reagents for characterizing sites of ligand-receptor interaction.

A zsiq33 ligand-binding polypeptide can also be used for purification of ligand. The polypeptide is 20 immobilized on a solid support, such as beads of agarose, cross-linked agarose, glass, cellulosic resins, silicabased resins, polystyrene, cross-linked polyacrylamide, or like materials that are stable under the conditions of Methods for linking polypeptides to solid supports 25 and include amine chemistry, in the art, known activation, N-hydroxysuccinimide bromide cyanogen activation, epoxide activation, sulfhydryl activation, and hydrazide activation. The resulting medium will generally be configured in the form of a column, and fluids 30 containing ligand are passed through the column one or more times to allow ligand to bind to the receptor The ligand is then eluted using changes in polypeptide. salt concentration, chaotropic agents (guanidine HCl), or 35 pH to disrupt ligand-receptor binding.

assay system that uses a ligand-binding receptor (or an antibody, one member of a complement/ anti-complement pair) or a binding fragment thereof, and a commercially available biosensor instrument (BIAcore™, 5 Pharmacia Biosensor, Piscataway, NJ) may be advantageously Such receptor, antibody, member employed. complement/anti-complement pair or fragment is immobilized onto the surface of a receptor chip. Use of this instrument is disclosed by Karlsson, J. Immunol. Methods 145:229-40, 1991 and Cunningham and Wells, J. Mol. Biol. 10 A receptor, 234:554-63, 1993. antibody, member fragment is covalently attached, using amine or sulfhydryl chemistry, to dextran fibers that are attached to gold film within the flow cell. A test sample is passed through the cell. If a ligand, epitope, or opposite member of the complement/anti-complement pair is present in the sample, it will bind to the immobilized receptor, antibody or member, respectively, causing a change in the refractive index of the medium, which is detected as a change in surface plasmon resonance of the gold film. 20 This system allows the determination of on- and off-rates, from which binding affinity can be calculated, assessment of stoichiometry of binding.

Ligand-binding receptor polypeptides can also be used within other assay systems known in the art. Such systems include Scatchard analysis for determination of binding affinity (see Scatchard, <u>Ann. NY Acad. Sci. 51</u>: 660-72, 1949) and calorimetric assays (Cunningham et al., <u>Science 253</u>:545-48, 1991; Cunningham et al., <u>Science 245</u>:821-25, 1991).

zsig33 polypeptides can also be used to prepare antibodies that specifically bind to zsig33 epitopes, peptides or polypeptides. Methods for preparing polyclonal and monoclonal antibodies are well known in the art (see, for example, Sambrook et al., Molecular Cloning: A Laboratory Manual, Second Edition, Cold Spring Harbor,

15

NY, 1989; and Hurrell, J. G. R., Ed., Monoclonal Hybridoma Antibodies: Techniques and Applications, CRC Press, Inc., Boca Raton, FL, 1982, which are incorporated herein by reference). As would be evident to one of ordinary skill in the art, polyclonal antibodies can be generated from a variety of warm-blooded animals, such as horses, cows, goats, sheep, dogs, chickens, rabbits, mice, and rats.

The immunogenicity of a zsig33 polypeptide may be increased through the use of an adjuvant, such as alum (aluminum hydroxide) or Freund's complete or incomplete adjuvant. Polypeptides useful for immunization also include fusion polypeptides, such as fusions of zsig33 or a portion thereof with an immunoglobulin polypeptide or with maltose binding protein. The polypeptide immunogen may be a full-length molecule or a portion thereof. If the polypeptide portion is "hapten-like", such portion may be advantageously joined or linked to a macromolecular carrier (such as keyhole limpet hemocyanin (KLH), bovine serum albumin (BSA) or tetanus toxoid) for immunization.

As used herein, the term "antibodies" includes 20 affinity-purified polyclonal polyclonal antibodies, monoclonal antibodies, and antigen-binding antibodies, fragments, such as $F(ab')_2$ and Fab proteolytic fragments. Genetically engineered intact antibodies or fragments, such as chimeric antibodies, Fv fragments, single chain 25 antibodies and the like, as well as synthetic antigenbinding peptides and polypeptides, are also included. Non-human antibodies may be humanized by grafting only non-human CDRs onto human framework and constant regions, or by incorporating the entire non-human variable domains 30 (optionally "cloaking" them with a human-like surface by replacement of exposed residues, wherein the result is a antibody). In some instances, antibodies may retain non-human residues within the human variable region framework domains to enhance proper 35 binding characteristics. Through humanizing antibodies,

biological half-life may be increased, and the potential for adverse immune reactions upon administration to humans is reduced. Alternative techniques for generating or selecting antibodies useful herein include in vitro exposure of lymphocytes to zsig33 protein or peptide, and selection of antibody display libraries in phage or similar vectors (for instance, through use of immobilized or labeled zsig33 protein or peptide).

Antibodies are defined to be specifically binding if they bind to a zsig33 polypeptide with a binding affinity (K_a) of 10⁶ M⁻¹ or greater, preferably 10⁷ M⁻¹ or greater, more preferably 10⁸ M⁻¹ or greater, and most preferably 10⁹ M⁻¹ or greater. The binding affinity of an antibody can be readily determined by one of ordinary skill in the art (for example, by Scatchard analysis).

A variety of assays known to those skilled in the art can be utilized to detect antibodies which specifically bind zsig33 to proteins or peptides. Exemplary assays are described in detail in Antibodies: A 20 Laboratory Manual, Harlow and Lane (Eds.), Cold Spring Harbor Laboratory Press, 1988. Representative examples of such assays include: concurrent immunoelectrophoresis, radioimmunoassay, radioimmuno-precipitation, enzyme-linked immunosorbent assay (ELISA), dot blot or Western blot inhibition or competition assay, and assay. In addition, antibodies can be screened for binding to wild-type versus mutant zsig33 protein or peptide.

Antibodies to zsig33 may be used for tagging cells that express zsig33 for isolating zsig33 by affinity purification; for diagnostic assays for determining circulating levels of zsig33 polypeptides; for detecting or quantitating soluble zsig33 as marker of underlying pathology or disease; in analytical methods employing FACS; for screening expression libraries; for generating anti-idiotypic antibodies; and as neutralizing antibodies

or as antagonists to block zsig33 activity in vitro and in vivo. Suitable direct tags or labels include radionuclides, enzymes, substrates, cofactors, inhibitors, fluorescent markers, chemiluminescent markers, magnetic particles and the like; indirect tags or labels may feature use of biotin-avidin or other complement/anticomplement pairs as intermediates. Antibodies herein may also be directly or indirectly conjugated to drugs, toxins, radionuclides and the like, and these conjugates used for in vivo diagnostic or therapeutic applications.

Molecules of the present invention can be used identify and isolate receptors that mediate function of zsig33. For example, proteins and peptides of the present invention can be immobilized on a column and 15 membrane preparations run over the column (Immobilized Affinity Ligand Techniques, Hermanson et al., eds., San Diego, CA, 1992, pp.195-202). Academic Press, Proteins and peptides can also be radiolabeled (Methods in Enzymol., vol. 182, "Guide to Protein Purification", M. Deutscher, ed., Acad. Press, San Diego, 1990, 721-737) or 20 photoaffinity labeled (Brunner et al., Ann. Rev. Biochem. 62:483-514, 1993 and Fedan et al., Biochem. Pharmacol. 33:1167-1180, 1984) and specific cell-surface proteins can be identified.

The polypeptides, nucleic acid and/or antibodies 25 of the present invention may be used in treatment of with gastrointestinal disorders associated contractility, secretion of digestive enzymes and acids, motility, recruitment of digestive gastrointestinal inflammation, particularly as it affects the 30 gastrointestinal system; reflux disease and regulation of Specific conditions that nutrient absorption. benefit from treatment with molecules of the present invention include, but are not limited to; diabetic gastroparesis, post-surgical gastroparesis, vagotomy, 35 chronic idiopathic intestinal pseudo-obstruction

gastroesophageal reflux disease. Additional uses include, gastric emptying for radiological studies, stimulating gallbladder contraction and antrectomy.

The motor and neurological affects of molecules of the present invention make it useful for treatment of obesity and other metabolic disorders where neurological feedback modulates nutritional absorption. The molecules of the present invention are useful for regulating satiety, glucose absorption and metabolism, and neuropathy-associated gastrointestinal disorders.

Molecules of the present invention are also useful as additives to anti-hypoglycemic preparations containing glucose and as adsorption enhancers for oral drugs which require fast nutrient action. Additionally, molecules of the present invention can be used to stimulate glucose-induced insulin release.

For pharmaceutical use, the proteins of the present invention are formulated for parenteral, nasal particularly intravenous or subcutaneous, inhalation, delivery according to conventional methods. Intravenous administration will be by bolus injection or infusion over a typical period of one to several hours. In general, pharmaceutical formulations will include a zsig33 protein in combination with a pharmaceutically acceptable vehicle, 25 such as saline, buffered saline, 5% dextrose in water or Formulations may further include one or more the like. excipients, preservatives, solubilizers, buffering agents, albumin to prevent protein loss on vial surfaces, etc. Methods of formulation are well known in the art and are disclosed, for example, in Remington's Pharmaceutical 30 Sciences, Gennaro, ed., Mack Publishing Co., Easton PA, herein reference. which incorporated рy is Therapeutic doses will generally be in the range of 0.1 to 100 $\mu g/kg$ of patient weight per day, preferably 0.5-20 µg/kg per day, with the exact dose determined by the 35 clinician according to accepted standards, taking into account the nature and severity of the condition to be treated, patient traits, etc. Determination of dose is within the level of ordinary skill in the art. The proteins may be administered for acute treatment, over one week or less, often over a period of one to three days or may be used in chronic treatment, over several months or years. For example, a therapeutically effective amount of zsig33 is an amount sufficient to produce a clinically significant change in gastric motility and parameters used to measure changes in nutritional absorption. Specific tests for making such measurements are known to these ordinarily skilled in the art.

Examples

15

Example 1

Scanning of a cDNA database for cDNAs containing a secretion sequence revealed an expressed sequence tag (EST) that has homology to motilin. The cDNA is from a 20 human fetal pancreatic cDNA library.

Confirmation of the EST sequence was made by sequence analyses of the cDNA from which the EST originated. This cDNA was contained in a plasmid, and was excised using cloning sites. The analyses revealed that the cDNA encompassed the entire coding region of the DNA encoding zsig33.

Example 2

Northerns were performed using Human Multiple Tissue Blots and Human RNA Master dot blots from Clontech The probe was approximately 40 bp (Palo Alto, CA). oligonucleotide ZC12,494 (SEQ ID NO: 7). The probe was T4 Polynucleotide Kinase (Life labeled using end Gaithersburg, MD) Technologies, Inc., Polynucleotide Kinase Forward Buffer (Life Technologies, The probe was purified using a NUCTRAP push

columns (Stratagene, La Jolla, CA). EXPRESSHYB (Clontech) for used prehybridization solution was and as the solution for hybridizing Northern Hybridization took place at 42°C, and the blots were washed in 2X SSC and 0.05% SDS at RT, followed by a wash in 1 X SSC and 0.1% SDS at 71°C. An approximately 600 bp transcript was observed as a strong signal in stomach, with weaker signals seen in pancreas and small intestine.

10 Example 3

35

Two male Sprague-Dawley rats, approximately 12 weeks old (Harlan, Indianapolis, IN) were anesthetized with urethane and their stomachs were exposed through a small abdominal incision. Two 2.4 mm transducing crystals (Sonometrics, Ontario, Canada) were placed on the antral portion of the stomach such that circular contractions could be monitored as a change in the distance between the two crystals. The crystals were attached with VETBOND TISSUE ADHESIVE (3M, St. Paul, MN).

20 10 μM acetylcholine was μl of 1 topically to the stomach between the two crystals, and resulted in a rapid, but transient increase distance between two crystals. 10 µl of norepinephrine (NE) at 1 μ M caused a reduction in the distance between 25 The amplitude of the NE-induced the two crystals. decrease was approximately 50% of the acetylcholineinduced increase in distance. Both responses were transient.

A negative control of 10 μl of phosphate buffer 30 solution (PBS) applied topically between the crystals had no effect.

A 14 amino acid zsig33 peptide (from amino acid residue 24 (Gly) to amino acid residue 37 (Gln) of SEQ ID NO: 2) was dissolved in PBS) and 10 μ l was applied topically for a final concentration of 1 μ g, 10 μ g or 100 μ g. The zsig33 at 1 μ g induced a sustained,

rhythmic increase and decrease in crystal distance. This effect appeared to be dose-dependent, with enhanced responses in both rate and amplitude when of the contractions 10 µg and 100 µg were tested.

5

Example 4

Eight female ob/ob mice, approximately 6 weeks old (Jackson Labs, Bar Harbor, ME) were adapted to a 4 hour daily feeding schedule for two weeks. weeks on the feeding schedule, the mice were give 100 μg 10 of a 14 amino acid amino zsig33 peptide (from amino acid residue 24 (Gly) to amino acid residue 37 (Gln) of SEQ ID 2) in 100 μ l sterile 0.1% BSA by oral gavage, immediately after their eating period (post-prandially). Thirty minutes later, the mice were challenged orally with a 0.5 ml volume of 25% glucose. Retroorbital bleeds were done to determine serum glucose levels. Blood was drawn prior to zsig33 dosing, prior to oral glucose challenge, and at 1, 2, 4, and 20 hours following the glucose challenge. 20

When zsig33 peptide was given orally at 100 μ g, 30 minutes prior to an oral glucose challenge, an enhanced post-prandial glucose absorption was seen.

25 Example 5

zsig33-1, a peptide corresponding to amino acid residue 24 (Gly) to amino acid residue 37 (Gln) of SEQ ID NO: 2, was synthesized by solid phase peptide synthesis Peptide Synthesizer (Applied using a model 431A 30 Biosystems/Perkin Elmer, Foster City, CA). Fmoc-Glutamine resin (0.63 mmol/g; Advanced Chemtech, Louisville, KY) was used as the initial support resin. 1 mmol amino acid cartridges (Anaspec, Inc. San Jose, CA) were used for A mixture of 2(1-Hbenzotriazol-y-yl 1,1,3,3synthesis. hexafluorophosphate 35 tetrahmethylhyluronium hydroxybenzotriazol (HOBt), 2m N,N-Diisolpropylethylamine,

N-Methylpyrrolidone, Dichloromethane (all from Applied Biosystems/Perkin Elmer) and piperidine (Aldrich Chemical Co., St. Louis, MO), and used for synthesis reagents.

The Peptide Companion software (Peptides International, Louisville, KY) was used to predict the aggregation potential and difficulty level for synthesis for the zsig33-1 peptide. Synthesis was performed using single coupling programs, according to the manufacturer's specifications.

The peptide was cleaved from the solid phase 10 following standard TFA cleavage procedure (according to Peptide Cleavage manual, Applied Biosystems/Perkin Elmer). Purification of the peptide was done by RP-HPLC using a C18, 10 µm semi-peparative column (Vydac, Hesperial, CA). 15 Eluted fractions from the column were collected and analyzed for correct mass and purity by electrospray mass Two pools of the eluted material were spectrometry. The mass spectrometry analysis collected. indicated that both pools contained the purified form of 20 zsig33 with a mass of 1600 Daltons. This was the expected mass, so the pools were combined, frozen and lyophilized.

Example 6

zsig33 was mapped to chromosome 3 using the
25 commercially available "GeneBridge 4 Radiation Hybrid
Panel" (Research Genetics, Inc., Huntsville, AL). The
GeneBridge 4 Radiation Hybrid Panel contains DNAs from
each of 93 radiation hybrid clones, plus two control DNAs
(the HFL donor and the A23 recipient). A publicly
30 available WWW server (http://www-genome.wi.mit.edu/cgibin/contig/rhmapper.pl) allows mapping relative to the
Whitehead Institute/MIT Center for Genome Research's
radiation hybrid map of the human genome (the "WICGR"
radiation hybrid map) which was constructed with the
35 GeneBridge 4 Radiation Hybrid Panel.

For mapping of zsig33 with the "GeneBridge 4 RH 20 μ l reactions were set up in a microtiter plate (Stratagene, La Jolla, CA) and used in a "RoboCycler Gradient 96" thermal cycler (Stratagene). Each of the 95 PCR reactions consisted of 2 μ l 10X KlenTaq PCR reaction buffer (CLONTECH Laboratories, Inc., Palo Alto, CA), 1.6 μ l dNTPs mix (2.5 mM each, Perkin-Elmer, Foster City, CA), 1 μ l sense primer, ZC13,166 (SEQ ID NO: 8), 1 μ l antisense primer, ZC13,167 (SEQ ID NO: 9), 2 μ l "RediLoad" (Research Genetics, Inc., Huntsville, AL), 0.4 10 Advantage KlenTaq Polymerase Mix (Clontech μ l 50X Laboratories, Inc.), 25 ng of DNA from an individual hybrid clone or control and ddH2O for a total volume of 20 The reactions were overlaid with an equal amount of 15 mineral oil and sealed. The PCR cycler conditions were as follows: an initial 1 cycle 5 minute denaturation at 95°C, 35 cycles of a 1 minute denaturation at 95°C, 1 minute annealing at 64°C and 1.5 minute extension at 72°C, followed by a final 1 cycle extension of 7 minutes at 72°C. The reactions were separated by electrophoresis on a 3% NuSieve GTG agarose gel (FMC Bioproducts, Rockland, ME). results showed that zsig33 maps cR_3000 from the framework marker AFMA216ZG1 on the WICGR chromosome 3 radiation hybrid map. Proximal and distal AFMA216ZG1 and D3S1263, were 25 framework markers respectively. The use of surrounding markers positions 3p26.1 region on the integrated LDB in the Genetic Location (The Database, chromosome 3 map

WWW

server:

rats (6 animals, 8 weeks old) were fasted 24 hrs prior to being anesthetized with urethane (0.5 ml/100 grams of 25% solution). After anesthetizing, the animals were orally gavaged with 1 ml of Phenol Red solution (50 mg/ml in 2% methylcellulose solution).

The stomach of each animal was exposed through a small abdominal incision and either 1 μ g zsig33 peptide or a 14 amino acid control of a scrambled sequence peptide was applied topically to the stomach five minutes following the gavage. The amount of Phenol Red remaining in the stomach was determined by measuring optical density of the extracted stomach contents 30 minutes after the gavage.

The zsig33 peptide reduced the amount of Phenol Red remaining in the stomach by approximately 25% compared to a scrambled peptide, indicating that the zsig33 peptide enhanced gastric emptying in these rats.

Example 8

Sixteen female ob/ob mice, 8 weeks old, (Jackson 20 Labs, Bar Harbor, ME) were adapted to a special 4 hour daily feeding schedule for two weeks. The were fed ad libitum from 7:30-11:30 am daily. After two weeks on the feeding schedule, the mice were divided into two groups of 8. One group was given 1.0 µg/mouse of zsig33-1 (14 amino acid peptide) and the other vehicle (a 14 amino acid scrambled sequence peptide) in 100 μl sterile 0.1% BSQA by oral gavage just prior to receiving food, and at the end The mice were injected of the 4 hour feeding period. twice daily for fourteen days, during which time food intake and body weight was measured daily. One day 14, immediately after the second oral gavage of the zsig33-1 peptide, the mice were challenged orally with an 0.5 ml volume of 25% glucose. Retro-orbital bleeds were done to serum glucose levels immediately prior 35 determine administration of the zsig33-1 peptide or vehicle (t=30

min.), and also at 0, 1, 2, and 4 hours following the glucose challenge.

Results indicated that when zsig33-1 given orally at 1 μ g/mouse had no affect on daily body weight or 5 food intake measurements, or on glucose clearance as determined on day 14.

Example 9

- A. Gut Northern Tissue Blot
- 10 A Northern blot was prepared using mRNA from the following sources:
 - RNA from Human Colorectal Andenocarcinoma cell line SW480 (Clontech, Palo Alto, CA)
- RNA from human small intestine tissue
 (Clontech)
 - 3. RNA from human stomach tissue (Clontech)
 - 4. Human Intestinal Smooth Muscle cell line (Hism; ATCC No.CRL-1692; American Type Culture Collection, 12301 Parklawn Drive, Rockville, MD)
- 5. Normal Human Colon cell line (FHC; ATCC No. CRL-1831; American Type Culture Collection)
 - 6. Human Normal Fetal Small Intestine cell line (FHs74 Int.; ATCC No. CCL241; American Type Culture Collection).
- Total RNAs were isolated from Hism, FHC and FHs74 Int. by acid guanidium method (Chomczynski et al., Anal. Biochem. 162:156-159, 1987). The polyA⁺ RNAs were selected by eluting total RNA through a column that retains polyA⁺ RNAs (Aviv et al., Proc. Nat. Acad. Sci.
- 30 69:1408-1412, 1972). 2 μg of polyA⁺ RNA from each sample was separated out in a 1.5% agarose gel in 2.2 M formaldehyde and phosphate buffer. The RNAs were transferred onto Nytran membrane (Schleicher and Schuell, Keene, NH) in 20X SSC overnight. The blot was treated in
- 35 the UV Stratalinker 2400 (Stratagene, La Jolla, CA) at 0.12 Joules. The bolt was then baked at 80°C for one hour.

Using the full length cDNA (shown in SEQ ID NO:

1) amplified by PCR approximately 50 ng of zsig33 DNA and
42.5 µl of water was radiolabeled with ³²P dCTP using a
Rediprime pellet kit (Amersham, Arlington Heights, IL)
according to the manufacturer's specifications. The blot
was hybridized in EXPRESSHYB (Clontech) at 55°C overnight.
The blot was washed at room temp. in 2X SSC and 0.1% SDS,
then in 2X SSC and 0.1% SDS at 65°C, and finally at 65°C in
0.1X SSC and 0.1% SDS. Results showed that zsig33
hybridized to stomach RNA and not to other RNAs from other
tissue origins.

B. Tumor Northern Blot

20

25

A Northern Territory™ -Human Tumor Panel Blot II (Invitrogen, San Diego, CA) and a Northern Territory™ - Human Stomach Tumor Panel Blot (Invitrogen) were analyzed for expression patterns of zsig33 RNA.

The Human Tumor Panel Blot contained 20 μg of total RNA per lane and was run on a 1% denaturing formaldehyde gel. The blot contained RNA from: esophageal tumor, normal esophagus, stomach tumor, normal stomach, colon tumor, normal colon, rectal tumor and normal rectum. The Stomach Tumor Panel Blot contained total RNA isolated human and normal tissues of four separate donors. 20 μg of RNA was used for each sample lane and the lanes alternated a normal and tumor set from each donor.

approximately 40 Probes that were qd oligonucleotide ZC12,494 (SEQ ID NO: 7) were prepared. The probes were end labeled using T4 Polynucleotide Kinase Inc., Gaithersburg, MD) (Life Technologies, Polynucleotide Kinase Forward Buffer (Life Technologies, 30 The probes were purified using a NUCTRAP push columns (Stratagene, La Jolla, CA). The tumor blot and the stomach blot were both treated in the same way. (Clontech) **EXPRESSHYB** solution was used for prehybridization and as a hybridizing solution for the Northern blots. Hybridization took place at 42°C, and the blots were washed in 0.1X SSC and 0.01% SDS at 60°C, followed by a wash in 0.1X SSC and 0.1% SDS at 70°C. The results clearly indicate that zsig33 is exclusively expressed in normal stomach tissue in both the Human Tumor 5 Panel and the Human Stomach Tumor Panel.

From the foregoing, it will be appreciated that, although specific embodiments of the invention have been described herein for purposes of illustration, various modifications may be made without deviating from the spirit and scope of the invention. Accordingly, the invention is not limited except as by the appended claims.

CLAIMS

- 1. An isolated polynucleotide molecule encoding a polypeptide selected from the group consisting of:
- (a) polynucleotide molecules comprising a nucleotide sequence as shown in SEQ ID NO: 1 from nucleotide 70 to nucleotide 111;
 - (b) allelic variants of (a);
 - (c) orthologs of (a) and (b); and
- (d) degenerate nucleotide sequences of (a), (b) or (c).
- 2. An isolated polynucleotide molecule encoding a polypeptide selected from the group consisting of:
- (a) polynucleotide molecules comprising a nucleotide sequence as shown in SEQ ID NO: 1 from nucleotide 70 to nucleotide 120;
 - (b) allelic variants of (a):
 - (c) orthologs of (a) or (b); and
- (d) degenerate nucleotide sequences of (a), (b) or (c).
- 3. An isolated polynucleotide molecule encoding a polypeptide selected from the group consisting of:
- (a) polynucleotide molecules comprising a nucleotide sequence as shown in SEQ ID NO: 1 from nucleotide 70 to nucleotide 351:
 - (b) allelic variants of (a);
 - (c) orthologs of (a) or (b); and
- (d) degenerate nucleotide sequences of (a), (b) or (c).
- 4. An isolated polynucleotide molecule encoding a polypeptide selected from the group consisting of:

- (a) polynucleotide molecules comprising a nucleotide sequence as shown in SEQ ID NO: 1 from nucleotide 1 to nucleotide 111;
 - (b) allelic variants of (a);
 - (c) orthologs of (a) or (b); and
- (d) degenerate nucleotide sequences of (a), (b) or (c).
- 5. The isolated polynucleotide molecule of claim 4, wherein said polynucleotide molecule further comprises the nucleotide sequence as shown in SEQ ID NO: 1 from nucleotide 1 to nucleotide 351.
- 6. The isolated polynucleotide of claim 1, wherein the polynucleotide is DNA.
- 7. An expression vector comprising the following operably linked elements:
 - a transcription promoter;
 - a DNA segment selected from the group consisting of:
- (a) polynucleotide molecules comprising a nucleotide sequence as shown in SEQ ID NO: 1 from nucleotide 70 to nucleotide 111;
 - (b) allelic variants of (a);
 - (c) orthologs of (a) or (b); and
- (d) degenerate nucleotide sequences of (a), (b) or (c);
 - a transcription terminator.
- 8. A cultured cell into which has been introduced an expression vector according to claim 7, wherein said cell expresses the polypeptide encoded by the DNA segment.
- 9. An isolated polypeptide selected from the group consisting of:

- (a) polypeptide molecules comprising an amino acid sequence as shown in SEQ ID NO: 2 from residue 24 to residue 37;
 - (b) allelic variants of (a); and
 - (c) orthologs of (a) or (b).
- 10. An isolated polypeptide selected from the group consisting of:
- (a) polypeptide molecules comprising an amino acid sequence as shown in SEQ ID NO: 2 from residue 24 to 41;
 - (b) allelic variants of (a); and
 - (c) orthologs of (a) or (b).
- 11. An isolated polypeptide selected from the group consisting of:
- (a) polypeptide molecules comprising an amino acid sequence as shown in SEQ ID NO: 2 from residue 24 to residue 117;
 - (b) allelic variants of (a); and
 - (c) orthologs of (a) or (b).
- 12. An isolated polypeptide selected from the group consisting of:
- (a) polypeptide molecules comprising an amino acid sequence as shown in SEQ ID NO: 2 from residue 1 to residue
 - (b) allelic variants of (a); and
 - (c) orthologs of (a) or (b).
- 13. The isolated polypeptide of claim 9, wherein said polypeptide molecules further comprises an amino acid sequence as shown in SEQ ID NO: 2 from residue 1 to residue 117.

- 14. A pharmaceutical composition comprising purified polypeptide according to claim 9, in combination with a pharmaceutically acceptable vehicle.
- 15. An antibody that binds to an epitope of a polypeptide selected from the group consisting of:
- (a) polypeptide molecules comprising an amino acid sequence as shown in SEQ ID NO: 2 from residue 24 to residue 117;
 - (b) allelic variants of (a); and
 - (c) orthologs of (a) or (b).

WO 98/42840

16. A method of producing zsig33 polypeptide comprising:

culturing a cell into which has been introduced an expression vector according to claim 7, whereby said cell expresses a polypeptide encoded by the DNA segment; and recovering the polypeptide.

- 17. A method of stimulating gastric motility comprising administering to a mammal in need thereof, an amount of a pharmaceutical composition comprising an isolated polypeptide selected from the group consisting of:
- (a) polypeptide molecules comprising an amino acid sequence as shown in SEQ ID NO: 2 from residue 24 to residue 37;
 - (b) allelic variants of (a); and
 - (c) orthologs of (a) or (b);

sufficient to increase transit time or gastric emptying of an ingested substance.

18. The method of claim 17, wherein the transit time or gastric emptying is measured using a radiolabeled substance.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
1. X Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely: Although claims 17 and 18 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)
This International Searching Authority found multiple inventions in this international application, as follows:
1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
Remark on Protest The additional search fees were accompanied by the applicant's protest. No protest accompanied the payment of additional search fees.
